| Special advice for mercury | 9-10 |
| Special advice for PCBs & other chemicals | 11-19 |
| For more info | 20 |

If you enjoy eating fish, the information in this brochure will help you plan how much fish you can safely eat. This information is not intended to discourage you from eating fish, but should be used as a guide to select fish that are low in contaminants.

Eating Your Catch

Fishing is fun and fish are good to eat in moderation. Fishing is a Wisconsin tradition. It is a sport anyone can participate in and is a great reason to get outdoors anytime of the year.

When properly prepared, fish provide a diet high in protein and low in saturated fats. Many doctors suggest that eating 1 to 2 meals of fish each week is helpful in preventing heart disease. Almost any kind of fish is a healthy replacement for a high-fat source of protein in the diet.

However, fish may take in pollutants from the water they live in and the food they eat. Some pollutants can build up in the fish to levels that can be harmful to fish consumers – including humans. You can get the health benefits of fish while reducing unwanted contaminants by following this advisory. You and your family should determine the type and amount of fish you eat and compare that to the advice in this guide. After consulting the advisory, you may find that you do not have to change your consumption habits at all, or you may choose to eat different fish or space fish meals farther apart.

“People should put their consumption habits in context with the advice found in this brochure. Most people will find they do not have to drastically alter their current fish-eating habits.”

- Dr. Henry Anderson Wisconsin Division of Health

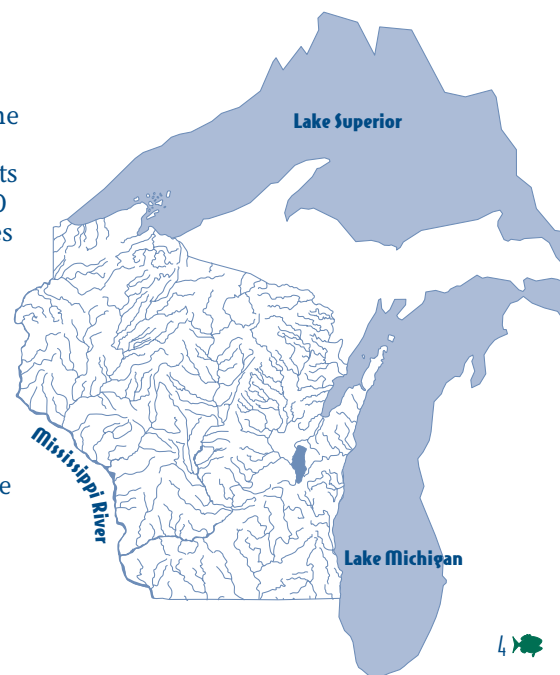

Fish testing sites

Wisconsin's fish collection and testing program is frequently adjusted to meet changing needs. New sites are tested each year, along with some previously tested waters to determine trends in contaminant levels.

Wisconsin is rich in water resources. There are nearly 15,000 lakes and 32,000 miles of rivers located within the state, as well as Lakes Michigan and Superior and the Mississippi River on its borders. Since testing began, over 1600 sites have been tested. The state focuses its sampling program in:

- ▶ waters with known or suspected pollution;
- ▶ lakes that may be susceptible to mercury contamination;
- ▶ popular angling waters;
- ▶ waters where changes with time are being tracked.

You can still eat fish from waters that the state has not yet tested. Just follow the guidance on page 7.

Advisory – Statewide and Special Advice

Recent studies found that low levels of mercury affect the developing nervous systems in fetuses. Wisconsin's fish consumption advisory for mercury reflects the latest scientific findings to better protect human health.

Because fish from most waters contain mercury at levels that require consumption advice, Wisconsin developed appropriate advice that applies to most inland waters. Special guidance is also provided for waters that require more restrictive advice because higher mercury levels or PCBs have been documented.

Specific advice is given on how many meals of fish a person may safely eat. The number of recommended meals falls into categories based on the average contaminant levels for a given fish size, species and location.

Wisconsin's fish consumption advisory is based on the work of public health, water quality and fisheries experts from eight Great Lakes states and the Canadian province of Ontario.

Based on the best available scientific evidence, these scientists determined how much fish is safe to eat over a lifetime based on the amount of contaminants found in the fish and how those contaminants affect human health. In developing the recommendations presented in this guide, health officials considered a range of possible health risks such as cancer, hormonal and immune system effects, but placed the most weight on fetal/child developmental problems.

Although this advisory is based on reproductive risks rather than cancer, some contaminants do cause cancer in animals. Your risk of cancer from eating contaminated fish cannot be predicted with certainty. Cancer currently affects about one in every two men and one in every three women by the age of 70, primarily due to smoking, diet and hereditary factors. Exposure to contaminants in the fish you eat may not increase your cancer risk at all. If you follow this advisory over your lifetime, you will minimize your exposure and reduce whatever cancer risk is associated with these contaminants. At worst, using Environmental Protection Agency (EPA) methods, it is estimated that approximately one additional cancer case may develop in 10,000 people who follow this advisory over their lifetime.

Contaminants of concern

Two main contaminants are responsible for fish advisories in Wisconsin. They are **polychlorinated biphenyls (PCBs)** and **mercury**. These contaminants differ

in where they come from, where they accumulate in fish, and how they affect human health.

Contaminants such as PCBs and mercury build up in your body over time. It may take months or years of frequently eating contaminated fish to build up amounts that are a concern to health. Health problems which may result from the contaminants found in fish range from changes in subtle effects that are hard to detect, to birth defects and cancer.

| Contaminant | PCBs | Mercury |
|---|--|--|
| What is it? Where does it come from? | Polychlorinated biphenyls(PCBs) are synthetic (man-made) substances that were used in the manufacture of electrical transformers, carbonless papers, cutting oils, and hydraulic fluids. Manufacture of PCBs was banned in the US in 1977. However, because PCBs are slow to break down in the environment, they remain a problem. | Mercury occurs in the environment naturally and as a result of human activity. It is released into the air when rocks erode, volcanoes erupt and soils decompose. It is also released into the air when power plants burn coal, incinerators burn mercury-containing waste and during the production of other chemicals. Airborne mercury attaches itself to water and dust particles and enters lakes and other waters in rain, snow and runoff. |
| What water bodies contain the contaminant? | PCBs released into the environment accumulate in sediments at the bottom of lakes and streams. The Great Lakes and rivers with heavy industrial use, are more likely to have PCB contaminated fish than inland lakes. This is because industries associated with past PCB use are often located on major rivers and Great Lakes tributaries. | Mercury is found in all waters. Lakes and wetland areas are more likely to contain bacteria which changes the mercury into a form that is easily absorbed by fish and other organisms. Therefore those waters tend to have fish with higher mercury concentrations. |
| What types of fish contain the most contaminants? Where is it found in fish? | <p>Fish absorb PCBs from contaminated sediments suspended in the water and from their food. The amount of PCBs found in fish varies depending on species, age, size, fat content and diet. Larger and older fish will contain more contaminants than smaller, younger fish. PCBs accumulate in the fat of fish. Therefore, fatty fish like carp and catfish may contain higher levels of PCBs.</p> <p>Fortunately you can reduce (not eliminate) the amount of PCBs in a fish meal by properly trimming, skinning and cooking your catch to reduce fatty tissue (page 11).</p> <p>Cooking does not destroy PCBs but heat from cooking melts some of the fat in fish and allows some of the contaminated fat to drop away. Broil, grill or bake the trimmed, skinned fish on a rack so the fat drips away. Do not use the drippings to prepare sauce or gravies.</p> | <p>Walleyes and other larger, older predatory fish often contain relatively high mercury levels compared to smaller fish such as bluegills, crappie and yellow perch, or smaller fish of the same species from the same lake or river. Fish absorb mercury directly from water passing over their gills or by ingesting other mercury contaminated organisms.</p> <p>Mercury accumulates throughout the fish, including the part that you eat. Therefore, trimming, skinning, and cooking do not reduce mercury levels in fish.</p> |
| What is its effect on human health? | <p>Studies indicate that people exposed to PCBs are at greater risk for a variety of health problems. Infants and children of women who have eaten a lot of contaminated fish may have lower birth weights and be delayed in physical development and learning. PCBs may affect reproductive function and the immune system and are also associated with cancer risk.</p> <p>Once eaten, PCBs are stored in body fat for many years. Each time you ingest PCBs the total amount of PCB in your body increases.</p> | <p>Fetuses and children under the age of 15 are more sensitive to mercury than adults. Mercury, unlike PCB, poses a short-term health risk to people who frequently eat fish that contain this contaminant. Mercury affects the human nervous system. Mercury can damage developing brains of children and may affect a child's behavior and ability to learn.</p> <p>The human body can eliminate mercury. Therefore, spacing your meals out over time can help reduce the amount of mercury in your system.</p> |

How to use this advisory

- 1) Read the safe-eating guidelines on page 7. **These guidelines apply to fish from most of Wisconsin's inland (non-Great Lakes) waters.**
- 2) Determine if your fishing spot has additional, special advice. Special advice is necessary for some species of fish from 143 waters where fish have higher concentrations of mercury or PCBs.
 - See pages 9-10 for a list of waters (by county) where special advice applies to waters due to higher concentrations of mercury. These waters are found in the counties highlighted in blue on the map (see right).

- See pages 11-19 for a list of waters (by name) where special advice applies due to PCBs. These waters are shown in green on the map (see right) and include Lake Michigan, Lake Superior, Green Bay, and several larger rivers.

- 3) Measure your fish from the tip of the nose to the end of the tail and follow the advice appropriate for the species of fish and length.

- 4) If the waterbody or fish species does not appear in the special tables, follow the safe-eating guidelines on page 7. For fish from stores or restaurants, see page 8.

Safe-eating guidelines – for most of Wisconsin's inland (non-great lakes) waters

Women of childbearing years, nursing mothers and all children under 15 may eat:*

1 meal per week – Bluegill, sunfish, black crappie, white crappie, yellow perch or bullheads,

And

1 meal per month – Walleye, northern pike, smallmouth bass, largemouth bass, channel catfish, flathead catfish, white sucker, drum, burbot, sauger, sturgeon, carp, white bass, rock bass or other species.*

Black Crappie

Women beyond their childbearing years and men may eat:

Unlimited amounts – Bluegill, sunfish, black crappie, white crappie, yellow perch, or bullheads,

And

1 meal per week– Walleye, northern pike, smallmouth bass, largemouth bass, channel catfish, flathead catfish, or other species.

Bluegill

**Muskie should not be eaten by this group of people due to high mercury content*

Muskie

Channel Catfish

White Bass

On certain waters more restrictive advice is needed because fish have been found to contain higher levels of mercury or PCBs. Please check the tables on the following pages.

Advisories apply only to eating your catch and in no way restrict your fishing or other water activities.

Purchased fish

People often ask about the levels of contaminants in fish bought in stores or restaurants. The Food and Drug Administration (FDA) sets tolerance levels for contaminants to regulate the interstate sale of fish. Recently, FDA and EPA issued fish consumption advice for women (of childbearing age) and children for commonly eaten commercial fish species. The FDA/EPA advice recommends that up to 12 ounces of fish that are low in mercury be eaten per week to obtain the health benefits of fish and shellfish. Please see the FDA/EPA Consumer Advice for more information

Fish purchased in stores and restaurants may also contain contaminants. Follow these guidelines for popular commercial species to reduce your exposure to mercury:

| Purchased Species | Women of child-bearing age and children under 15 | Women beyond child-bearing age and men |
|---|--|--|
| Salmon, shrimp, canned light tuna, pollock, catfish | 2 meals per week | Unlimited Consumption |
| Canned white tuna, tuna steaks, halibut | 2 meals per month | 1 meal per week |
| Shark, swordfish, king mackerel, tilefish | Do Not Eat | 1 meal per month |

(www.cfsan.fda.gov/seafood1.html) and to determine which commercial fish species are safest.

Because fish bought in a store or restaurant do not come with labels that tell you the contaminant levels, or even where the fish came from, it is up to the consumer to ask about the source of the

fish. In addition to checking the FDA/EPA advice it is important to eat a variety of fish species to ensure that you do not eat a steady diet of fish with high levels of contaminants. In addition, check with state and local agencies for information on the safety of fish from lakes, rivers, and coastal areas.

Eating crayfish, clams and turtles

Some people may be interested in eating other organisms

besides fish caught in Wisconsin waters. Crayfish, clams and snapping turtles may be harvested from Wisconsin waters as long as rules and regulations affecting these species are followed.

These aquatic or semi-aquatic animals can accumulate the same contaminants that occur in fish, but the levels aren't necessarily the same. For example, clams generally have lower contaminant levels because they filter food particles from the water and do

not eat organisms higher on the food chain. Snapping turtles eat higher on the food chain, but have very defined fat deposits that can be removed during cleaning to reduce any fat-soluble contaminants that might be present, such as PCBs.

Some sites have "Do Not Eat" warnings for many species of fish. Before catching and dining on wild fare from these sites, it's best to contact a local DNR office for more information on species from specific sites.

Parasites and tumors in fish

Anglers sometimes catch fish that contain worms, grubs, cysts, or nodules in the flesh. When cleaning fish, anglers

may notice worms in or around the intestines of the fish. Common parasites seen in fish are black spot, yellow grubs and tapeworms.

Fish parasites are a normal part of the ecosystem. While unattractive, parasites do not present a health hazard if the fish is thoroughly cooked. Pickling will not always kill tapeworm common to northern pike. Therefore, canning methods that include a boiling water bath are recommended.

Occasionally fish have external growths, tumors, sores or other lesions, due generally to viral or bacterial infections. Damaged or infected tissue should be removed. Select the healthy tissue for cooking and eating.

Special advice for mercury

While all fish contain some mercury, large fish, especially walleye contain more mercury than small fish, like perch. In certain lakes and rivers, the sensitive natural water chemistry allows the mercury to bioaccumulate more easily, leading to higher levels of mercury in the fish. The following table contains special advice for fish that have been found to contain mercury at higher levels. Women of childbearing age who intend on becoming pregnant and children under 15 should be especially careful to follow the guidance in the table.

Yellow Perch

The lakes and rivers listed in the table have been tested and found to contain fish with higher levels of mercury. **This advice is just for the species and sizes of fish listed below.** Other species caught from these waters but not listed below or in the specific advice for PCBs can still be eaten according to the safe-eating guidelines on page 7.

Walleye

Important note regarding fish on the mercury portion of the advisory:

Mercury is distributed throughout a fish's muscle tissue (the part you eat) rather than in the fat and skin. The only way to reduce mercury intake is to reduce the amount of contaminated fish you eat.

| County | Water body | Women of childbearing age and children under 15 | | County | Water body | Women of childbearing age and children under 15 | |

* Women beyond their childbearing age and men are advised to eat no more than 1 meal per week of these panfish species.

Special advice for PCBs and other chemicals

Important: The meal advice in the PCB portion of this guide is for eating fish prepared according to this diagram.

One meal is assumed to be one-half pound of fish before cooking for a 150-pound person. This meal advice is equally protective for larger people who eat larger meals, and smaller people who eat smaller meals.

If you are a woman of childbearing age who intends to become pregnant, or are under the age of 15, you should be especially careful to space fish meals out according to these advisory tables.

Women beyond their childbearing years and men face fewer health risks from contaminants. However, if you are in this group you should still follow the advisory to reduce your total exposure to contaminants. You can space your meals more closely, but it is still important not to exceed the total number of meals per year, as specified in the advisory. For example, if you are on vacation and most of the fish you eat fall into the “One meal a week” category, you could eat several of these meals within the same week as long as you do not exceed 52 total meals the rest of the year.

| Waterbody/Species | Unlimited | Eat no more than 1 meal a week or 52 meals/year | Eat no more than 1 meal a month or 12 meals/year | Eat no more than 1 meal every 2 months or 6 meals/year | Do Not Eat |
